HTML Basics

Problem #1 a. Describe 3 characteristics

-Well-structured (Clear features): I believe that a good website should be visually appealing to the users. To be specific, the images, texts, buttons, or any kinds of items of the website should be clearly arranged. I believe that this can be completely done by using html and css.

-Many useful functions: websites are usually made with at least one purpose. For example, a restaurant makes an website to introduce itself or the menus, and an online shopping mall makes an website to show and sell its products. A good website should provide various kinds of function for the users. This can be mainly done by using javascript.

-Meaningful graphics: If an website is only with lots of texts and information, users will very likely to be bored. So a good website should have some images or tools to describe the texts. Symbols and images strongly support users to understand and use the websites. For example, a symbol of a finger next to a button will imply the users that this is "a button to click".

Problem #1 b. Provide a screenshot of a website

Starbuck's website: https://www.starbucks.com/
